

- SQL schema creation scripts.

```
CREATE TABLE customers (  
    customer_id VARCHAR(20) PRIMARY KEY,  
    customer_name VARCHAR(100),  
    region VARCHAR(20)  
);
```

```
CREATE TABLE products (  
    product_id VARCHAR(20) PRIMARY KEY,  
    product_name VARCHAR(100),  
    category VARCHAR(50),  
    price DOUBLE PRECISION  
);
```

```
CREATE TABLE transactions (  
    transaction_id VARCHAR(20) PRIMARY KEY,  
    customer_id VARCHAR(20),  
    product_id VARCHAR(20),  
    quantity INTEGER,  
    discount DOUBLE PRECISION,  
    total_amount DOUBLE PRECISION,  
    transaction_date TIMESTAMP,
```

```
CONSTRAINT fk_customer  
    FOREIGN KEY (customer_id)  
    REFERENCES customers(customer_id),
```

```
CONSTRAINT fk_product  
    FOREIGN KEY (product_id)  
    REFERENCES products(product_id)  
);
```

- SQL query scripts with sample outputs.

1. Total sales by region and category.

```
391
392 ✓ SELECT
393     c.region,
394     p.category,
395     SUM(t.total_amount) AS total_sales
396 FROM transactions t
397 JOIN customers c 1..n<->1: ON t.customer_id = c.customer_id
398 JOIN products p 1..n<->1: ON t.product_id = p.product_id
399 GROUP BY c.region, p.category
400 ORDER BY total_sales DESC;
```

Output Result 15 ×

	region	category	total_sales
1	North	Electronics	4600
2	South	Electronics	900
3	North	Furniture	600
4	West	Electronics	600
5	East	Electronics	270
6	North	Accessories	240

9 rows

2. Top 5 products by total revenue.

```
391
392 ✓ SELECT
393     p.product_name,
394     SUM(t.total_amount) AS revenue
395 FROM transactions t
396 JOIN products p ON t.product_id = p.product_id
397 GROUP BY p.product_name
398 ORDER BY revenue DESC
399 LIMIT 5;
```

Output Result 16 ×

	product_name	revenue
1	Laptop	5500
2	Monitor	870
3	Desk	600
4	Keyboard	410
5	Mouse	290

5 rows

3. Monthly sales trend.

```
391
392 ✓ SELECT
393     💡 DATE_TRUNC('month', transaction_date) AS month,
394     SUM(total_amount) AS total_sales
395 FROM transactions
396 GROUP BY month
397 ORDER BY month;
```

Output Result 17 ×

- Index creation and explanation of performance impact: Indexes make data retrieval faster by allowing the database to quickly locate relevant rows instead of scanning the entire table.

-- For joins

```
CREATE INDEX idx_transactions_customer ON transactions(customer_id);
```

```
CREATE INDEX idx_transactions_product ON transactions(product_id);
```

-- For filtering/grouping

```
CREATE INDEX idx_customers_region ON customers(region);
```

```
CREATE INDEX idx_products_category ON products(category);
```
